The Social Determinants of Health and Structural Interventions

Key Points

- The social determinants of health are the range of social, economic and environmental factors that determine the health status of individuals or populations.
- Social determinants of health play a role in HIV infection and the ability of people with HIV to seek treatment, care and support.
- Structural approaches to HIV prevention seek to change the social, economic, political and environmental factors that have an impact on resilience and vulnerability to HIV.
- Structural interventions should be part of a comprehensive prevention package.

The determinants of health are the range of social, economic and environmental factors that determine the health status of individuals or populations. The determinants of health as defined by the Public Health Agency of Canada include the following: income and social status, social support networks, education and literacy, employment/working conditions, social environments, physical environments, personal health practices and coping skills, healthy child development, biology and genetic endowment, health services, gender and culture.

Many factors in our society, including poverty, physical and sexual abuse, lack of education, homelessness, stigma, addiction, violence, untreated mental health problems, lack of employment opportunities, powerlessness, lack of choice, lack of legal resident status and lack of social support, play a role in HIV infection and the ability of people living with HIV to seek treatment, care and support. For example, poverty can lead to powerlessness in relationships and can have a negative impact on one’s self-esteem and sense of belonging in the community. All of this can have an impact on one’s judgement or can reduce one’s ability to protect oneself from HIV.

The understanding that physical, social, cultural, organizational, community, economic, legal and policy factors within our environments can impede or facilitate HIV prevention efforts has led to an interest in structural approaches to HIV prevention. Structural interventions seek to change the context that contributes to an individual’s resilience, vulnerability and risk. They include policies or programs that aim to change the conditions in which people live or community responses that bring about social or political change. These approaches address factors that affect the individual’s behaviour, in contrast with behavioural approaches, which attempt to change the behaviour. Structural approaches to HIV prevention must be complemented by other prevention programming, including interventions to influence individual behaviour, to achieve an effective and continued reduction in HIV risk and vulnerability.

Examples of structural HIV prevention initiatives include the following:

- creation of a policy and legal environment that allows for needle exchange programs and safer consumption sites
- implementation of anti-stigma measures that reduce discrimination against people with HIV and vulnerable groups
- implementation of gender equality initiatives, including programs to enhance women’s education and economic independence and laws to combat sexual violence
- implementation of stable housing initiatives for injection drug users
- encouragement and funding for the active involvement of affected communities in developing and promoting HIV prevention interventions

Before structural interventions are implemented in a particular community, the social, economic, political and environmental facilitators and barriers to HIV risk within that context must be analyzed. Existing programs that have been successful elsewhere should then be reviewed for possible adaptation and adoption in the community of interest.
Many structural features that affect HIV vulnerability are difficult to change because they are deeply entrenched in the social, economic and political fabric of society; therefore, addressing these factors is viewed as a long-term initiative within broader economic and social development. Challenges in assessing the effectiveness of structural interventions have meant that limited evidence has been gathered on the effectiveness of structural approaches to HIV prevention. Most structural interventions involve large-scale elements that cannot be easily controlled by experimental or quasi-experimental research designs. There is a need for new research strategies to assess the impact of these interventions to create a foundation of knowledge on structural interventions.

Disclaimer

Decisions about particular medical treatments should always be made in consultation with a qualified medical practitioner knowledgeable about HIV- and hepatitis C-related illness and the treatments in question.

CATIE provides information resources to help people living with HIV and/or hepatitis C who wish to manage their own health care in partnership with their care providers. Information accessed through or published or provided by CATIE, however, is not to be considered medical advice. We do not recommend or advocate particular treatments and we urge users to consult as broad a range of sources as possible. We strongly urge users to consult with a qualified medical practitioner prior to undertaking any decision, use or action of a medical nature.

CATIE endeavours to provide the most up-to-date and accurate information at the time of publication. However, information changes and users are encouraged to ensure they have the most current information. Users relying solely on this information do so entirely at their own risk. Neither CATIE nor any of its partners or funders, nor any of their employees, directors, officers or volunteers may be held liable for damages of any kind that may result from the use or misuse of any such information. Any opinions expressed herein or in any article or publication accessed or published or provided by CATIE may not reflect the policies or opinions of CATIE or any partners or funders.

Information on safer drug use is presented as a public health service to help people make healthier choices to reduce the spread of HIV, viral hepatitis and other infections. It is not intended to encourage or promote the use or possession of illegal drugs.
